## **Unit 20 Engineering: Primary Forming Processes (Edexcel)**

### **Question 1: What is primary forming?**

Primary forming involves the conversion of raw materials (e.g., metal ingots, plastic pellets) into semi-finished or finished products through various processes that physically alter their shape and structure.

### **Question 2: Describe the major primary forming processes.**

- **Casting:** Molten metal or plastic is poured into a mold to solidify and take the shape of the mold.
- **Forging:** Metal is heated and shaped through mechanical force (e.g., hammering, pressing).
- **Rolling:** Metal or plastic is passed through rollers to reduce its thickness and increase its length.
- **Extrusion:** Metal or plastic is forced through a die to create a specific profile or shape.
- **Drawing:** Metal is pulled through a die to reduce its cross-sectional area and increase its length.

### **Question 3: What are the advantages of casting?**

- Ability to create complex shapes
- Relatively low production costs
- Suitable for a wide range of materials (e.g., metals, plastics, composites)

### **Question 4: What are the limitations of forging?**

- Restricted to producing relatively small and simple shapes
- High tooling costs

- Susceptible to material defects (e.g., porosity)

#### **Question 5: How does rolling differ from extrusion?**

- Rolling reduces the thickness of material, while extrusion creates a specific shape or profile.
- Rolling is a continuous process, while extrusion is a semi-continuous process.
- Rolling requires less force than extrusion, but it is limited in the shapes it can produce.
