Unit 1 Experimental Design Exercise 2: TeamNovaFo

Question 1: State the hypothesis for your experiment.

Answer: Our hypothesis is that the type of fertilizer used will have a significant effect on the growth of tomato plants.

Question 2: Describe the experimental design you used.

Answer: We conducted a controlled experiment with three treatment groups: one group received a nitrogen-rich fertilizer, one group received a phosphorus-rich fertilizer, and one group received a potassium-rich fertilizer. We planted tomato

seedlings in pots and randomly assigned them to one of the three treatment groups. We grew the plants for eight weeks, watering them and fertilizing them according to the treatment group they were assigned to. At the end of the eight weeks, we measured the height of each plant.

Question 3: What were the results of your experiment?

Answer: We found that the type of fertilizer had a significant effect on the growth of tomato plants. The plants that received the nitrogen-rich fertilizer grew significantly taller than the plants that received the phosphorus-rich fertilizer or the potassium-rich fertilizer.

Question 4: What are the possible explanations for the results of your experiment?

Answer: There are several possible explanations for the results of our experiment. One possibility is that nitrogen is an essential nutrient for plant growth, and the plants that received the nitrogen-rich fertilizer were able to grow taller because they had more nitrogen available to them. Another possibility is that the nitrogen-rich fertilizer promoted the growth of beneficial bacteria in the soil, which in turn helped the plants to grow taller.

Question 5: What are the implications of your results for tomato growers?

Answer: The results of our experiment suggest that tomato growers may be able to increase the yield of their tomato plants by using a nitrogen-rich fertilizer. However, further research is needed to confirm this finding and to determine the optimal amount of nitrogen to use.
