## **Statics Equilibrium Problems in Physics with Solutions**

---

### **MACBETH ACT 1 QUESTION AND ANSWERS**

### **Paragraph 1:**

Statics equilibrium is a fundamental concept in physics that deals with the balance of forces acting on a system. A system is said to be in static equilibrium when the net force and net torque acting on it are both zero. This means that the system is not accelerating and will remain at rest or in uniform motion.

#### **Question:**

Three forces act on a particle: a force of 10 N to the right, a force of 5 N to the left, and a force of 8 N upward. What is the net force acting on the particle?

#### **Answer:**

The net force is calculated by adding the forces in each direction. In the x-direction, the net force is  $10\text{ N} - 5\text{ N} = 5\text{ N}$  to the right. In the y-direction, the net force is 8 N upward. Therefore, the net force acting on the particle is 5 N to the right and 8 N upward.

### **Paragraph 2:**

To solve statics equilibrium problems, it is often useful to use Newton's laws of motion. Newton's second law states that the net force acting on an object is equal to the mass of the object multiplied by its acceleration. Since an object in static equilibrium has zero acceleration, the net force acting on it must also be zero.

#### **Question:**

A block of mass 10 kg is hanging from a rope. What is the tension in the rope?

#### **Answer:**

The tension in the rope must be equal to the weight of the block, which is given by:

$$\text{Weight} = \text{mass} \times \text{gravity} \quad \text{Weight} = 10\text{ kg} \times 9.8\text{ m/s}^2 \quad \text{Weight} = 98\text{ N}$$

Therefore, the tension in the rope is 98 N.

### **Paragraph 3:**

Another important concept in statics equilibrium is torque. Torque is a measure of the force that tends to twist or rotate an object about an axis. The magnitude of torque is equal to the force multiplied by the perpendicular distance from the axis of rotation to the line of action of the force.

**Question:**

A force of 10 N is applied at the end of a lever arm of length 0.5 m. What is the torque about the pivot point?

**Answer:**

The torque is calculated by multiplying the force by the lever arm length:

$$\text{Torque} = \text{force} \times \text{lever arm length} \quad \text{Torque} = 10 \text{ N} \times 0.5 \text{ m} \quad \text{Torque} = 5 \text{ Nm}$$

Therefore, the torque about the pivot point is 5 Nm.

**Paragraph 4:**

To solve statics equilibrium problems involving torque, it is often useful to use the principle of moments. The principle of moments states that for a system to be in static equilibrium, the algebraic sum of the torques acting on it must be zero.

**Question:**

A beam of length 2 m is pivoted at its center. A weight of 10 N is suspended from one end of the beam, and a weight of 5 N is suspended from the other end. At what distance from the pivot point should the 5 N weight be placed to balance the beam?

**Answer:**

Using the principle of moments, we can write:

$$10 \text{ N} \times 1 \text{ m} = 5 \text{ N} \times \text{distance} \quad \text{Distance} = 2 \text{ m}$$

Therefore, the 5 N weight should be placed 2 m from the pivot point to balance the beam.

**Paragraph 5:**

---

Statics equilibrium problems are common in many areas of physics, including mechanics, engineering, and architecture. Understanding the principles of statics equilibrium is essential for analyzing the stability of structures, designing machines, and solving a wide variety of problems in science and engineering.
