Systems of Equations Word Problems Worksheet Answers

Systems of equations are a powerful tool for solving algebraic word problems. By setting up and solving systems of equations, students can find the unknown variables and solve the problem.

Question 1:

Two trains leave different cities at the same time and travel towards each other. Train A travels at 60 mph, and Train B travels at 70 mph. If the distance between the cities is 350 miles, how long will it take them to meet?

Answer:

Let t be the time it takes the trains to meet. Then the distance traveled by Train A is $60t$, and the distance traveled by Train B is $70t$. We can set up the equation $60t + 70t = 350$ and solve for t :

$$60t + 70t = 350$$

$$130t = 350$$

$$t = 2.69 \text{ hours}$$

Question 2:

A store sells two types of apples, Red Delicious and Granny Smith. Red Delicious apples cost \$0.50 each, and Granny Smith apples cost \$0.60 each. If a customer buys 10 apples for \$6.00, how many of each type of apple did they buy?

Answer:

Let x be the number of Red Delicious apples and y be the number of Granny Smith apples. Then we can set up the system of equations:

$$x + y = 10 \text{ (total number of apples)}$$

$$0.50x + 0.60y = 6.00 \text{ (total cost)}$$

Solving this system of equations, we get $x = 6$ and $y = 4$. The customer bought 6 Red Delicious apples and 4 Granny Smith apples.

Question 3:

A company makes two types of widgets, A and B. Widget A takes 2 hours to manufacture, and Widget B takes 3 hours to manufacture. If the company has 10 hours of production time available each day and wants to make twice as many Widget As as Widget Bs, how many of each type of widget can they make each day?

Answer:

Let x be the number of Widget As and y be the number of Widget Bs. Then we can set up the system of equations:

$$x + y = 10 \text{ (total number of widgets)}$$

$$2x = 3y \text{ (twice as many Widget As as Widget Bs)}$$

Solving this system of equations, we get $x = 6$ and $y = 3$. The company can make 6 Widget As and 3 Widget Bs each day.

Question 4:

A rectangular garden is 10 feet longer than it is wide. If the perimeter of the garden is 100 feet, what are the dimensions of the garden?

Answer:

Let x be the width of the garden. Then the length is $x + 10$. The perimeter is $2(\text{width} + \text{length})$. We can set up the equation $2(x + x + 10) = 100$ and solve for x :

$$2(x + x + 10) = 100$$

$$4x + 20 = 100$$

$$4x = 80$$

$$x = 20$$

The dimensions of the garden are 20 feet wide by 30 feet long.

Question 5:

A movie theater has two types of seats, regular and premium. Regular seats cost \$10 each, and premium seats cost \$15 each. If the theater sold 300 tickets for a total of \$3,900, how many of each type of seat was sold?

Answer:

Let x be the number of regular seats and y be the number of premium seats. Then we can set up the system of equations:

$$x + y = 300 \text{ (total number of seats)}$$

$$10x + 15y = 3,900 \text{ (total money earned)}$$

Solving this system of equations, we get $x = 200$ and $y = 100$. The theater sold 200 regular seats and 100 premium seats.
