SYBCA of Software Engineering Question Paper (Pune University) with Solutions

Instructions:

- The question paper consists of two sections, Section A and Section B.
- Section A contains short answer questions carrying 1 mark each.
- Section B contains long answer questions carrying 5 marks each.
- All questions are compulsory.

Section A: Short Answer Questions

1. What is software engineering?
2. Name the different phases of the software development life cycle.
3. What is the difference between a requirement and a specification?
4. What is the purpose of a feasibility study?
5. What are the advantages of using a structured design approach?

Section B: Long Answer Questions

1. **Explain the Waterfall Model of software development and discuss its advantages and disadvantages.**

Solution: The Waterfall Model is a sequential software development model that follows a linear progression through the following phases: requirements analysis, design, implementation, testing, and maintenance.

Advantages:

- Simple and easy to understand
- Provides a clear structure for the development process
- Ensures that each phase is completed before moving on to the next

Disadvantages:

- Inflexible and does not allow for changes to be made easily
- Can be time-consuming and costly
- Difficult to adapt to changing requirements

2. Discuss the role of requirements engineering in software development.

Solution: Requirements engineering is the process of identifying, documenting, and managing software requirements. It plays a critical role in software development by:

- Ensuring that the software meets the needs of its users
- Reducing the risk of misunderstandings between stakeholders
- Providing a basis for testing and evaluating software

3. **Describe the different software design patterns and explain how they can be used to improve software quality.**

Solution: Software design patterns are reusable solutions to common software development problems. They can be used to:

- Improve the quality of software by reducing defects and increasing maintainability
- Make software more adaptable to changing requirements
- Facilitate communication between developers

Some common design patterns include:

- **Creational patterns:** Used to create objects
- **Structural patterns:** Used to organize objects and classes
- **Behavioral patterns:** Used to describe how objects interact

4. **Explain the testing process and discuss the different types of software testing.**

Solution: Software testing is the process of evaluating software to ensure that it meets its requirements. Different types of software testing include:

- **Unit testing:** Tests individual units of code
- **Integration testing:** Tests how different units of code work together
- **System testing:** Tests the entire software system

- **Acceptance testing:** Tests the software against user requirements

5. **Describe the software maintenance process and discuss the challenges involved in maintaining software over time.**

Solution: Software maintenance is the process of updating, modifying, and servicing software after its initial release. Challenges involved in software maintenance include:

- **Changing requirements:** Software requirements can change over time, requiring the software to be updated
- **Code complexity:** As software grows in size and complexity, it becomes more difficult to maintain
- **Compatibility issues:** Software must be compatible with new hardware and software technologies
