**What is the difference between an electrical circuit and an electronic circuit?** The main difference between electrical and electronic circuits is that electrical circuits have no decision making (processing) capability, whilst electronic circuits do. **What are three examples of devices that need electricity in a circuit?** Light bulbs, fans, and buzzers are common loads. Think about a light bulb. When current passes through the wires inside the bulb, electrical energy changes into heat energy and light energy. Similarly, when current passes through a buzzer, electrical energy changes into sound energy.

**What is considered an electrical device?** Electric(al) devices are devices that functionally rely on electric energy (AC or DC) to operate their core parts (electric motors, transformers, lighting, rechargeable batteries, control electronics).

**What is an example of an electrical device?** Examples of electrical devices are electric fans (they work by converting electrical energy into rotational motion) and light bulbs (they transform electric energy into light).

**What is an electrical circuit example?** A simple electric circuit can consist of a battery (or other energy source), a light bulb (or other device that uses energy), and conducting wires that connect the two terminals of the battery to the two ends of the light bulb.

**What is an electrical circuit in a home?** A typical circuit in your home has two conductors: hot and neutral. Electricity travels from the service panel to home appliances through the hot conductor, and returns the current to the main service panel through the neutral conductor.
