What is the life expectancy of someone with Velo cardio facial syndrome?
Those with velocardiofacial syndrome (VCFS) but without serious heart defects can expect a normal lifespan.

Other common findings include minor learning problems and speech and feeding problems. Velocardiofacial syndrome is the most common syndrome associated with a cleft palate.

What is the life expectancy of a person born with 22q11 2 deletion syndrome?
One to two percent of children born with this syndrome have a life expectancy of two to three years; however, most individuals reach adulthood and can live a life span into the fifties. Early treatment should be considered for the most severe issues with this condition to prolong life expectancy.

What is DiGeorge syndrome caused by? DiGeorge syndrome is caused by a problem called 22q11 deletion. This is where a small piece of genetic material is missing from a person's DNA. In about 9 in 10 cases (90%), the bit of DNA was missing from the egg or sperm that led to the pregnancy. This can happen by chance when sperm and eggs are made.

Can velocardiofacial syndrome be cured? A child's eyes, nose, or ears may look different. Or the child may have an opening in the roof of the mouth (cleft palate).

The syndrome has no cure. But many related health problems can be treated.

Is velocardiofacial syndrome a disability? Children are born with these features. Children who have VCFS also often have learning difficulties and developmental delays. About 65 percent of individuals with the 22q11. 2 deletion are found to have a non-verbal learning disability.

Is velocardiofacial syndrome inherited? It's inherited in an autosomal dominant fashion, meaning if one parent has the syndrome, each child has a 50 percent chance of inheriting it. The name comes from the Latin words velum, meaning palate, cardia, meaning heart, and facies, meaning face.

What are the facial features of Velo cardio facial syndrome? Though there are a variety of presentations and phenotypes of velocardiofacial syndrome, a long narrow face with a tubular nose, thin palpebral fissures, and a small mouth are present in more than 90 percent of cases.

What are the facial features of DiGeorge syndrome? A number of particular facial features may be present in some people with 22q11. 2 deletion syndrome. These may include small, low-set ears, short width of eye openings (palpebral fissures), hooded eyes, a relatively long face, an enlarged nose tip (bulbous), or a short or flattened groove in the upper lip.

Does 22q11 2 run in families? Offspring of affected individuals have a 50% chance of inheriting the 22q11. 2 deletion. Once the 22q11. 2 deletion has been identified in an affected family member, prenatal testing using FISH, MLPA, or array studies for a pregnancy at increased risk and preimplantation genetic testing are possible.

Is 22q11 a disability? Developmental delay is often seen in children with 22q11. 2 deletion syndrome, including a delay in language. As the child grows older, intellectual disability and learning differences are likely to become more obvious. Verbal IQ is often greater than performance IQ as the child grows.

Is 22q11 a rare disease? The worldwide prevalence at birth is estimated at 1/4,500-1/10,000. 22q11. 2 deletion syndrome shows a variable clinical phenotype that can range from mild to severe.

What organ is missing in DiGeorge syndrome? Features of DGS include an absent or hypoplastic thymus, cardiac abnormalities, hypocalcemia, and parathyroid hypoplasia (See "History and Physical" below). Perhaps, the most concerning characteristic of DGS is the lack of thymic tissue, because this is the organ responsible for T lymphocyte development.

Can people with DiGeorge syndrome have children in the future? Impact on Fertility DiGeorge syndrome patients without immunodeficiency may not be at any increased for infertility. However, in DiGeorge syndrome patients with immunodeficiency due a T-cell deficiency, it can be due to being athymic [11].

Do babies with DiGeorge syndrome look different? The child may also have changes in how the eyes, nose, or ears look. Or the child may have an opening in the roof of the mouth (cleft palate), or decreased movement of the palate. Most children with the syndrome have only some of the health problems.

What is the life expectancy of Fraser disease? Fraser syndrome has a mixed life expectancy, with the most severe cases dying in their first year of life, while others can go on to live relatively normal lives.

What is the life expectancy of someone with rapid aging disease? Progeria is a fatal condition that causes early death. The average life expectancy of a person with progeria is 14.5 years. However, some children die as young as 6 years old, and some adults with progeria live into their early 20s. Death typically occurs as a result of complications from atherosclerosis.
