Unicode Conversion: Char to AnsiChar or WideChar in Delphi

Question: How do I convert a Unicode character (Char) into either an AnsiChar or a WideChar in Delphi?

Answer: Delphi provides functions for converting between different character types:

- **CharToAnsiChar(Char):** Converts a Unicode character to an AnsiChar (8-bit character for single-byte encodings like ASCII).
- **CharToWideChar(Char):** Converts a Unicode character to a WideChar (16 or 32-bit character for Unicode encodings like UTF-16 or UTF-32).

Example:

```
var
    unicodeChar: Char;
    ansiChar: AnsiChar;
    wideChar: WideChar;

unicodeChar := '?'; // Unicode character: MUSICAL NOTE

ansiChar := CharToAnsiChar(unicodeChar);
wideChar := CharToWideChar(unicodeChar);
```

Question: What are the limitations of converting Unicode to AnsiChars? _____

Answer: Converting Unicode to AnsiChars is only possible for characters that are supported by the current AnsiChar encoding. If the Unicode character is not supported, a question mark (?) will be returned.

Question: How do I know the current AnsiChar encoding?

Answer: You can use the `GetACP` function to retrieve the current AnsiChar code page (encoding). For example:

```
var
    codePage: Integer;

codePage := GetACP;

if codePage = CP_UTF8 then
    // AnsiChars are Unicode-compatible UTF-8 characters
else
    // AnsiChars are not Unicode-compatible
```

Question: Which conversion function should I use for WideString?

Answer: WideString is a Unicode string type, so you should use `CharToWideChar` to convert individual Unicode characters into WideChars.
