Textbook of Animal Physiology with Related Biochemistry: A Question and Answer Guide

Q: What is the primary function of the liver in relation to metabolism? A: The liver plays a crucial role in metabolism by regulating blood glucose levels, synthesizing proteins, and breaking down fats and carbohydrates.

Q: How does the cardiovascular system contribute to the transport of nutrients and waste products in the body? A: The cardiovascular system, which includes

the heart, blood vessels, and blood, facilitates the transport of essential nutrients, oxygen, hormones, and waste products throughout the body.

Q: Explain the role of hormones in regulating physiological processes. Give an example. A: Hormones are chemical messengers that regulate various physiological processes by binding to specific receptors. For instance, insulin, produced by the pancreas, helps to lower blood glucose levels by promoting the uptake of glucose into cells.

Q: What are the key differences between skeletal muscle, smooth muscle, and cardiac muscle? A: Skeletal muscle is voluntary, striated, and attached to bones. Smooth muscle is involuntary, non-striated, and found in organs such as the gastrointestinal tract. Cardiac muscle is also involuntary and striated, but it is specialized for electrical conduction and the pumping action of the heart.

Q: Discuss the process of neurotransmission and its role in the nervous system. A: Neurotransmission involves the release of neurotransmitters from the presynaptic cell, which then bind to receptors on the postsynaptic cell. Neurotransmitters facilitate communication between neurons and regulate various body functions, including movement, sensation, and thought processes.
