### **Solutions for Inorganic Chemistry by Miessler Gary (4th Edition)**

**Q: What is the difference between a strong and a weak acid?**

**A:** A strong acid completely dissociates in water, releasing all of its protons. A weak acid only partially dissociates, releasing only a small fraction of its protons.

**Q: How does pH affect the solubility of metal ions?**

**A:** The solubility of metal ions generally decreases as pH increases. This is because metal ions react with hydroxide ions to form insoluble metal hydroxides.

**Q: What is the coordination sphere of a metal ion?**

**A:** The coordination sphere of a metal ion is the group of atoms or molecules that are bonded to the metal ion. The coordination sphere can include ligands, which are atoms or molecules that donate electron pairs to the metal ion.

**Q: What is the difference between a chelating ligand and a monodentate ligand?**

**A:** A chelating ligand is a ligand that can donate more than one electron pair to a metal ion, forming a ring structure. A monodentate ligand can donate only one electron pair to a metal ion.

**Q: How does the Irving-Williams series predict the stability of metal complexes?**

**A:** The Irving-Williams series is a qualitative ranking of the stability of metal complexes with different metal ions. The series states that the stability of metal complexes increases with increasing atomic number for the metal ion.
