Transport Processes and Separation Process Principles Includes Unit Operations 4th Edition Solution for Problem

Question:

In a distillation column, a binary mixture of benzene and toluene is being separated. The feed stream contains 50% benzene and 50% toluene by mass. The distillate stream contains 90% benzene and 10% toluene by mass, while the bottoms stream contains 10% benzene and 90% toluene by mass. The feed rate is 100 kg/h. Determine the distillate and bottoms flow rates.

Answer:

Step 1: Perform a mass balance on the column.

$$\text{Feed} = \text{Distillate} + \text{Bottoms}$$

$$100 \text{ kg/h} = D + B$$

Step 2: Perform a mass balance on benzene in the column.

$$\text{Benzene in Feed} = \text{Benzene in Distillate} + \text{Benzene in Bottoms}$$

$$0.5 * 100 \text{ kg/h} = 0.9 * D + 0.1 * B$$

Step 3: Solve the equations simultaneously.

D = 55.56 kg/h

B = 44.44 kg/h

Therefore, the distillate flow rate is 55.56 kg/h and the bottoms flow rate is 44.44 kg/h.
