It stores information about domain members, including devices and users, verifies their credentials, and defines their access rights. The server running this service is called a domain controller.

**What is the fundamental distinction between a node and a host?** A node is a broader term that includes anything connected to a network, while a host requires an IP address. In other words, all hosts are nodes, but network nodes are not hosts unless they require an IP address to function. Hosts use various protocols to communicate, including TCP and User Datagram Protocol (UDP).

**What is network long answer?** A network consists of two or more computers that are linked in order to share resources (such as printers and CDs), exchange files, or allow electronic communications. Directory Services are often referred to as directories, user stores, Identity Stores, or LDAP Directory, and they store information such as usernames, passwords, user preferences, information about devices, and more.

**What is the name of the directory database that controls access to a Windows Server domain?** Active Directory (AD) is a database and set of services that connect users with the network resources they need to get their work done. The database (or directory) contains critical information about your environment, including what users and computers there are and who's allowed to do what.

**What is the protocol connection between the client browser and the web server machine?** HTTP is a protocol for fetching resources such as HTML documents. It is the foundation of any data exchange on the Web and it is a client-server protocol, which means requests are initiated by the recipient, usually the Web browser.

**What is the primary secure protocol used for communication between a browser and web server?** Hypertext transfer protocol secure (HTTPS) is the secure version of HTTP, which is the primary protocol used to send data between a web browser and a website. HTTPS is encrypted in order to increase security of data transfer.

**What is arrangement of computer network nodes and connections between them called?** A network topology is the physical and logical arrangement of nodes and connections in a network.

**What is a protocol in a computer?** In networking, a protocol is a set of rules for formatting and processing data. Network protocols are like a common language for computers. The computers within a network may use vastly different software and hardware; however, the use of protocols enables them to communicate with each other regardless.

**What is the interface between the process and the computer network?** The Interface between the Process and the Computer Network refers to the connection between a method running on a tool and the underlying laptop network. This interface determines how the method communicates with different methods and with the community itself.

**What is a computer connected to the server called?** The correct answer is Client. A Client is a program or a computer that connects to and requests information from a server. The computers which offer information are called Servers and the computers which seek information are called clients.

**What is network best answer?** A set of computers connected to share resources is known as a computer network. The primary resource shared over the network is the Internet. Another example is the sharing of a printer between different computers.

**What are the types of network answer?**

**What is the concept that many users can share a computer called?** A multi-user operating system (OS) is a computer system that allows multiple users that are on different computers to access a single system's OS resources simultaneously, as shown in this figure appearing on your screen right now. Users on the system are connected through a network.

**What is a network short answer?** A network is basically a collection of computers and other devices that are linked together to exchange data. Each device on the network is referred to as a node, and each node has its own address, which is a numerical value.

**What is network in 100 words?** Computer networks are used to connect multiple computers to an internet connection, or to printers, scanners, etc in the same area that the network covers. There are many types of networks that are classified using several different characteristics of each network.
