What are the basics of urology? Urology is a branch of medicine that deals with health problems of the male and female urinary systems, and the male reproductive system. The urinary tract stores and gets rid of urine (liquid waste) and extra water. The urinary tract is a pathway in the body. It includes the kidneys, ureters, bladder and urethra.

What is an urology procedure? Cystoscopy A cystoscopy is a urology procedure that allows a urologist to examine the lining of the bladder and the urethra. An instrument called a cystoscope is inserted into the urethra and guided to the bladder. The cystoscope is made up of a long, thin tube with a light and a camera at the end.

What is the study of urology? A urologist is a doctor who specializes in diagnosing and treating diseases of the urinary system. This system keeps the body clean by filtering out wastes and toxins and taking them out of the body. The urinary tract includes: Bladder.

How do I prepare for a urology test? Please prepare a list of all your medications, their doses, and any supplements you take. Bring detailed notes of your symptoms and try to recall when your symptoms began. If relevant, bring a diary of your daily food and drink intake. This will be very helpful in helping to create a plan of care for you.

What are 3 conditions a urologist might treat for their patients? Increased urinary frequency and urgency may be symptoms of several conditions that your urologist can diagnose and treat, including: Urinary tract infections. Enlarged prostate. Prostate cancer.

Why do urologists make so much? You may be able to command a higher salary due to a demand for this type of physician specialist. There is high demand for urologists due to an aging population, not enough new urologists and an aging workforce in the urology specialty.

What is the most commonly ordered test in urology? Urinalysis. The most common urine test performed is a urinalysis. In fact, in most yearly physical exams, urinalyses are done even if there is no cause for concern.

What will an urologist do on his first visit? Physical exam: The urologist will perform a physical exam concentrated on the genitourinary system, and evaluate other systems as well. The physician will perform a genital exam plus a digital rectal exam to assess the prostate.

What does an urologist do for a man? A urologist might treat bladder problems, urinary tract infections (UTIs), bladder and kidney cancer, kidney blockage, and kidney stones. Men might also see them for: Erectile dysfunction (ED) Enlarged prostate gland.

What are the red flags of bladder pain? Red-flag symptoms/signs Urethral/bladder pain. Recurrent urinary tract infection. Difficulty with bladder emptying. Constant leak suspicious for a urogenital fistula.

What is a nickname for a urologist? Adult urologists have plenty of nicknames, from “dick docs” to “stream team” to “prick plumbers”; my favorite is “wee-wee whackers.

What exactly does an urologist do? Urologists treat conditions involving the genitourinary system. For all patients, urologists treat conditions affecting the kidneys, ureters, bladder, and urethra. For female patients, urologists additionally treat conditions affecting the pelvic floor, such as pelvic organ prolapse and urinary incontinence.

What is basic urology course? Basic Urology Skills Course (Basic Urology Skills) At the end of the course, the participants will be able to perform circumcision, scrotal exploration, cystoscopy and stenting, suprapubic catheterisation They will have a better understanding of selection of appropriate adjuncts to each procedure.

What will an urologist do on his first visit? Physical exam: The urologist will perform a physical exam concentrated on the genitourinary system, and evaluate other systems as well. The physician will perform a genital exam plus a digital rectal exam to assess the prostate.

What should I tell my urologist? Be prepared to provide a full list of medications including over-the-counter drugs, vitamins, supplements, and prescriptions. Even if the medication isn't related to your genitourinary system, it may help give insight to other conditions that may have effects on your urologic problems.

What exactly does an urologist do? Urologists treat conditions involving the genitourinary system. For all patients, urologists treat conditions affecting the kidneys, ureters, bladder, and urethra. For female patients, urologists additionally treat conditions affecting the pelvic floor, such as pelvic organ prolapse and urinary incontinence.

What adaptations for life in the water did you observe in the perch? Perch have adapted gills in order to be able to breathe and live in water. Scales have been adapted to protect Perch from predators. Without swim bladders, perch would sink to the bottom of the water.

Which fin is the largest in the perch?

Where in the perch will you find the swim bladder? In the upper part of the body below the lateral line is the swim bladder. This sac has a thin wall and gives the fish buoyancy. Find the swim bladder using your anatomy paper as a guide. 10.

Which fins on a perch have spines? Fishes within the perch family have fins with both soft rays and stiff spines. The dorsal fin, located in the middle of the back, is divided into two sections; the front section is spiny and the rear section is soft rayed. The anal fin has two spines in front.

How is the perch better adapted to breathe underwater? Perch have an opercular flap that protects the internal gills and allows the fish to be able to force gas exchange when breathing in water through their mouth. Works Cited Adaptations in Fish.

What are 5 adaptations that fish have for water?

What protects the gills on a perch? Operculum: The operculum is the bony flap that protects the gills from harm. It opens and closes to allow water to pass over the gills. Pectoral Fin: The pectoral fin allows for abrupt changes in side-to-side direction

and speed.

How many gills does a perch have? There should be two pairs of gills on each side of the perch (4 total gills). Find the gill slits or spaces between the gills. Click [HERE](#) to find more information about gill rakers. Use your scalpel to carefully cut out one gill.

What is the function of the scales on a perch? Scales protect fish from predators and parasites and reduce friction with the water. Multiple, overlapping scales provide a flexible covering that allows fish to move easily while swimming.

What is the function of the gill rakers in a perch? Gill rakers are an anatomical feature of fish that aid in the gathering of food and protection of the gills. The rakers are located inside the oral cavity and point anteriorly from their attachment to the gill arch.

What is the function of the vertebrae in a perch? These fish share a unique sound detection system—the Weberian apparatus—which involves the swim bladder and modified elements of the first few trunk vertebrae. The vertebrae act as a conduction system between the swim bladder and the inner ear at the back of the skull.

What is the function of the bladder in a perch? The swim bladder is located in the body cavity and is derived from an outpocketing of the digestive tube. It contains gas (usually oxygen) and functions as a hydrostatic, or ballast, organ, enabling the fish to maintain its depth without floating upward or sinking.

What does the caudal fin do in a perch? The caudal fin, or tail fin, is located at the end of the fish and provides the power that propels the fish forward, like a motor. It also acts as a rudder to assist in steering.

What does the pelvic fin do in a perch? Pelvic fins: These are located on the underside of the fish and assist in maintaining balance. Anal fin: This fin, located near the tail, also helps in maintaining balance. Caudal fin (tail fin): This is the main propelling fin that pushes the fish forward in the water.

Where is the pectoral fin on a perch? Pectoral fins are located on either side of the fish near the gills. These fins do everything that pelvic fins do and also help steer

and control depth.

How does oxygen reach the gills of the perch? Fish exchange gases by pulling oxygen-rich water through their mouths and pumping it over their gills. Within the gill filaments, capillary blood flows in the opposite direction to the water, causing counter-current exchange.

How do perch get oxygen? Fish take water into their mouth, passing the gills just behind its head on each side. Dissolved oxygen is absorbed from—and carbon dioxide released to—the water, which is then dispelled. The gills are fairly large, with thousands of small blood vessels, which maximizes the amount of oxygen extracted.

What is unique about a perch? Perch have a long and round body shape which allows for fast swimming in the water. True perch have "rough" or ctenoid scales. Perch have paired pectoral and pelvic fins, and two dorsal fins, the first one spiny and the second soft.

Which class do 95% of all fish belong to? Class - Osteichthyes Osteichthyes includes the largest number of living species of all scientific classes of vertebrates, more than 28,000 species. Osteichthyes account for about 96% of all fish species.

What enables fish to swim? Fishes are adapted to their environment through the evolution of a few special organs e.g. gills, swim bladders and fins. Gills help in absorbing the oxygen present in the water and swim bladders allow to maintain the proper buoyancy level and fins help to move the fish in the water.

What are the 4 characteristics of fishes adapted to aquatic life? Gills (which allow fish to breathe underwater), coloration, body shape, light production, and venom production are a few of the adaptations we have explored.

What adaptations for life in the water did you observe in the fish describe what the adaptation does? Fishes are adapted to their environment through the evolution of a few special organs e.g. gills, swim bladders and fins. Gills help in absorbing the oxygen present in the water and swim bladders allow to maintain the proper buoyancy level and fins help to move the fish in the water.

What structures on the perch make it adapted for life in water? Perch and spiny dogfish have specific structures and functions that serve as adaptations for survival

in aquatic and marine environments. These include gills, a streamlined body, fins, a swim bladder, and well-developed sense organs.

What are some adaptations to life in water?

What are the special adaptations of the yellow perch? Yellow perch have small backward slanting teeth lining the jaws and gill rakers that strain out small pelagic food sources from the water (Herman et al 1959). Their mouth is subterminal which makes it easy for them to feed at the bottom (Parrish and Margraf 1990). Yellow perch swallow their food whole (Weatherly 1972).

Twin Stepbrother Celebrity Series: FAQs
