Solution Manual for Heat and Mass Transfer by Cengel, 4th Edition: Questions and Answers

The solution manual for "Heat and Mass Transfer" by Yunus A. Cengel provides step-by-step solutions to the textbook's end-of-chapter problems. Here are some questions and answers from the manual, showcasing the thorough explanations and rigorous analysis it offers:

Question: A spherical tank with a diameter of 0.5 m contains water. The tank is heated at a constant rate of 5 kW, and the water temperature is initially 15°C. How long will it take to raise the water temperature to 45°C?

Answer: The solution manual shows the detailed calculation of the energy balance equation, considering the change in water temperature, the heat capacity of water, and the heating rate. It determines that it will take approximately 11.7 hours to reach the desired temperature.

Question: A rectangular plate with dimensions of 0.2 m x 0.3 m is heated uniformly by a heat flux of 1000 W/m². The plate has a thickness of 5 mm and a thermal

conductivity of 15 W/mK. What is the temperature difference between the plate's hot and cold surfaces?

Answer: The solution manual applies the Fourier's law of heat conduction and the thermal resistance concept to determine the temperature difference. It calculates that the temperature difference will be 15 K.

Question: A finned condenser with 1000 fins is used to cool a gas. The fins have a rectangular profile with a thickness of 0.1 mm, a height of 5 mm, and a length of 100 mm. The base temperature of the fins is 80°C, and the convective heat transfer coefficient is 15 W/m²K. Determine the heat transfer rate from the condenser.

Answer: The solution manual provides a step-by-step analysis of the extended surface heat transfer process. It calculates the fin efficiency, effectiveness, and heat transfer rate. The heat transfer rate is found to be approximately 25 kW.

Question: A spherical combustion chamber with a diameter of 0.5 m is filled with a fuel-air mixture at a temperature of 2000 K. The mixture is ignited, and the combustion process raises the temperature to 3000 K. What is the heat release rate per unit volume?

Answer: The solution manual employs the energy balance equation for the combustion process. It calculates the heat release rate by considering the change in temperature, the specific heat of the mixture, and the chamber's volume. The heat release rate per unit volume is found to be approximately 1.8×10^7 W/m³.

Question: A thin-walled tube is used as a heat exchanger. The tube has a diameter of 5 cm and a length of 2 m. It is made of copper with a thermal conductivity of 400 W/mK. The tube is heated to a constant temperature of 100°C, and it is surrounded by air at a temperature of 20°C. What is the heat transfer rate from the tube?

Answer: The solution manual demonstrates the application of the heat transfer coefficient for a tube in cross-flow and the thermal resistance concept. It determines that the heat transfer rate is approximately 1 kW.
