Wheeler's Dental Anatomy, Physiology, and Occlusion 10th Edition: Q&A

Q: What is the primary function of the enamel in teeth? A: Protection and strength. The enamel acts as a hard, protective layer that shields the underlying dentin and pulp from damage.

Q: Describe the different types of teeth and their functions. A: There are four main types of teeth in humans: incisors (cutting), canines (tearing), premolars (crushing), and molars (grinding). Each type has a specific shape and function that aids in the breakdown of food for digestion.

Q: What is the role of the periodontal ligament in tooth support? A: The periodontal ligament is a fibrous tissue that connects the tooth to the surrounding bone. It acts as a shock absorber, protects the tooth from excessive forces, and provides sensory feedback for proprioception (awareness of tooth position).

Q: Explain the concept of occlusion and its importance. A: Occlusion refers to the alignment and contact of the teeth when the jaws are closed. Proper occlusion is essential for proper chewing, speech, and overall oral health. Malocclusion (incorrect alignment) can lead to a range of functional and aesthetic problems.

Q: What are the main factors that contribute to the development of dental caries (tooth decay)? A: Dental caries are caused by a combination of factors, including the presence of bacteria (*Streptococcus mutans*), the availability of fermentable carbohydrates (sugar), and the susceptibility of the tooth to acid erosion. Good oral hygiene, regular checkups, and a balanced diet are crucial for preventing caries.
