## **Section 21.1 Review Modern Biology Answers**

### **Paragraph 1:**

**Question:** What is the modern theory of evolution?

**Answer:** The modern theory of evolution, also known as the neo-Darwinian theory, states that evolution occurs through the process of natural selection acting on heritable variations within a population.

### **Paragraph 2:**

**Question:** Describe the process of natural selection.

**Answer:** Natural selection occurs when individuals with certain traits are better adapted to their environment and have a higher chance of surviving and reproducing. These individuals pass on their advantageous traits to their offspring, leading to the gradual accumulation of favorable traits within the population.

### **Paragraph 3:**

**Question:** What is the role of genetic variation in evolution?

**Answer:** Genetic variation within a population provides the raw material for natural selection to act upon. Variation arises from mutations, gene flow, genetic recombination, and other mechanisms.

### **Paragraph 4:**

**Question:** How does natural selection lead to the formation of new species?

**Answer:** Over time, natural selection can lead to the accumulation of so many advantageous traits within a population that it eventually becomes distinct from the original population. This can result in the formation of new species through the process of speciation.

#### **Paragraph 5:**

**Question:** What are some examples of evidence for evolution?

**Answer:** Evidence for evolution includes homologous structures, vestigial structures, genetic similarities, fossil records, and experiments. These lines of evidence provide strong support for the modern theory of evolution.
