Question 1:

Explain how a transformer converts AC electrical energy from one voltage level to another.

Answer:

A transformer is an electrical device that transfers energy between two or more circuits through electromagnetic induction. It works by using two coils of wire wrapped around a laminated iron core. When an alternating current (AC) is passed through the primary coil, it creates a changing magnetic field. This changing magnetic field induces an AC current in the secondary coil. The ratio of the number of turns on the primary coil to the number of turns on the secondary coil determines the voltage ratio of the transformer.

Question 2:

Describe the principle of superposition as applied to waves.

Answer:

The principle of superposition states that when two or more waves interact, the resultant wave is the sum of the individual waves. This principle applies to all types of waves, including water waves, sound waves, and electromagnetic waves. The superposition of waves can result in constructive interference, where the amplitudes of the waves add together, or destructive interference, where the amplitudes of the waves cancel each other out.

Question 3:

A car travels 50 km north in 1 hour and then turns and travels 30 km east in 30 minutes. Calculate the car's:

a) Average speed b) Average velocity

Answer:

a) Average speed = (Total distance / Total time) = (50 km + 30 km) / (1 hour + 30 minutes) = 60 km/h

b) Average velocity = (Displacement / Total time) = [(50 km north) + (30 km east)] / (1 hour + 30 minutes) = 40 km/h in the northeast direction

Question 4:

Explain the difference between a real image and a virtual image.

Answer:

A real image is formed when light rays actually converge at a point after passing through a lens or mirror. Real images can be projected onto a screen or viewed directly. A virtual image, on the other hand, is an image that is formed when light rays appear to diverge from a point after passing through a lens or mirror. Virtual images cannot be projected onto a screen but can be viewed through the lens or mirror.

Question 5:

Discuss the role of radioactive isotopes in medicine.

Answer:

Radioactive isotopes are isotopes that have an unstable nucleus and emit radiation. Some radioactive isotopes are used in medicine for diagnostic and therapeutic purposes. For example, iodine-131 is used to diagnose and treat thyroid disorders, while cobalt-60 is used to treat cancer. Radioactive isotopes play a vital role in nuclear medicine, providing valuable tools for diagnosing and treating various medical conditions.
