Cultivating Copelandia Cyanescens: A Comprehensive Guide

Copelandia cyanescens, also known as the Hawaiian blue meanie, is a psychoactive mushroom known for its potent effects. Cultivating this species at home requires specific conditions and techniques. Here are answers to frequently asked questions about its cultivation:

1. What Are the Cultivation Requirements?

C. cyanescens requires a humid and sterile environment. It prefers a substrate of hardwood sawdust, supplemented with manure or compost. The substrate should be pasteurized or sterilized to prevent contamination.

2. How to Prepare the Substrate?

Mix the sawdust with the manure or compost in a ratio of 2:1. Moisten the mixture until it can be pressed into a ball but not so wet that it becomes soggy. Pasteurization can be done by heating the substrate in a steamer or pressure cooker at 140-160°F (60-71°C) for 2-4 hours.

3. How to Inoculate the Substrate?

Once the substrate has cooled, inoculate it with a liquid culture or spore syringe. Spread the inoculant evenly throughout the substrate and mix gently.

4. Incubation and Fruiting

Place the inoculated substrate in a clean container with holes for air exchange. Incubate at 75-80°F (24-27°C) for 2-4 weeks, or until the substrate is fully colonized by mycelium. Once colonized, the substrate should be placed in a fruiting chamber with high humidity and indirect light.

5. Harvesting and Drying

When the mushrooms have matured, they can be harvested by gently twisting them off the substrate. The fresh mushrooms can be stored in the refrigerator for a short time or dried for long-term preservation. Dry the mushrooms in a dehydrator or oven set at 110-120°F (43-49°C) until they are completely dry and brittle.
