Communication issues include ad hoc networks and infrastructure networks as well as communication properties, protocols, data formats, and concrete technologies.

**What is mobile computing architecture?** The architecture of mobile computing relates to the several layers that are established between user applications, interfaces, devices, and network hardware. For systematic calculations and access to data and software objects in the layers, a clearly defined architecture is required.

**What is an example of mobile computing?** This may include cell phones, laptops, tablets, wearable computers and accompanying chargers and accessories.

**What is the difference between mobile computing and mobile communication?** Mobile computing enables connecting portable devices to wireless networks to access data and use services while moving. Mobile communication involves the infrastructure that is used to wirelessly transmit and receive data between devices seamlessly and safely.

network connection, such as Wi-Fi or cellular technology. These devices can store data locally and do not always require a network connection to access that data.

**What is three tier architecture for mobile computing?** This model structures an application into three distinct tiers: presentation (user interface), logic(business logic), and data (data storage). The fundamental advantage of 3-tier architecture lies in the clear separation of concerns.

**What are the two different types of mobility in mobile computing?**

**What is mobile computing also known as?** Explanation: Mobile computing is referred to as human-computer interaction, in which the computer is required to be transported during general usage.

**What are 5 examples of mobile device?** A mobile device can be any mobile computer or a variety of other electronic devices that have portable functionality. Typical examples include smartphones, tablets, laptop computers, smart watches, e-readers, and handheld gaming consoles.

The processing of the data and instructions are performed by Arithmetic Logical Unit.

**How do you remove cyanobacteria from drinking water?** Pre-chlorination is the most widely used strategy for enhancing the removal of cyanobacterial cells. Chlorine reacts with the cell membranes and intracellular materials after penetrating into the cells and stimulates the release of algal organic matter (AOM) along with the intracellular toxins (Qi et al., 2016).

**What can be done to reduce harmful cyanobacterial blooms?** One approach uses devices that mix the layers of water in lakes (for example, by air bubbling), resulting in enhanced vertical mixing of the phytoplankton and minimized formation of surface blooms made of floating cyanobacteria. Increasing water flow through lakes might also be used to prevent cyanobacteria blooms.

**Is algae bloom harmful to humans?** What are the health effects of harmful algal blooms? Depending on the type of algae, HABs can cause serious health effects and even death. For example, eating seafood contaminated by toxins from algae called Alexandrium can lead to paralytic shellfish poisoning, which can cause paralysis and even death.

**What do cyanobacteria do to humans?** Cyanobacteria produce toxins that can affect various parts of the body. Different species of cyanobacteria can produce toxins that can damage the liver (hepatotoxins), affect the central nervous system

(neurotoxins) and produce toxic alkaloids that affect the renal system and gastrointestinal tract.

**What happens if you drink water with cyanobacteria?** Key messages. Algae-affected water may not be suitable for drinking, recreation or agricultural use. Contact with affected water can cause skin irritation, mild respiratory effects and hayfever-like symptoms. Ingesting toxins can cause gastroenteritis symptoms, such as vomiting, diarrhoea, fever and headaches.

**How to treat drinking water with algae?** The best way to get rid of algae in drinking water is with a water filter. The type of water filter required will depend on the type of algae. For example, if there's a chance of blue-green algae (cyanobacteria) – which is actually a bacteria, not algae – nanofiltration, ultrafiltration, or reverse osmosis is best.

**How to get rid of an algae bloom?** The oldest and most widely used approach to controlling HABs involves the application of a certain types of clay during blooms. When sprinkled on surface waters during an algal bloom, the tiny but dense clay particles will “flocculate” or combine with other particles in the water, including the HAB cells.

**How do you treat cyanobacteria toxins?** There is no specific antidote for cyanotoxins, and treatment involves intensive, supportive care for patients experiencing shock or respiratory arrest. Treatments may include: IV fluids. Oxygen.

**How do you get rid of cyanobacteria algae?**

**Can algae bloom in water make you sick?** Key points. People and animals can get sick by touching, breathing in, or swallowing water with a harmful algal bloom. Eating contaminated food can also make you and your animals sick. Protect yourself, pets, and livestock by following advisories from local officials and staying out of water that looks or smells bad.

**How to tell if algae is toxic?** If it looks like paint was spilled on top of the water, that can be a sign of a harmful algal bloom. Foamy water can be a sign of a harmful algal bloom. Foamy water can be a sign of a harmful algal bloom. Globbs or mats of algae can be a sign of a harmful algal bloom.

**Is it safe to swim in algae bloom?** Harmful algal blooms are the rapid growth of algae or cyanobacteria in water that can harm people, animals, or the environment. Going in or near water with a harmful algal bloom can make you and your animals sick. Stay out if water looks discolored, has scum, or smells bad.

**Have people died from cyanobacteria?** Human Health Effects Caused by the Most Common Toxin-producing HABs Species. When people are exposed to cyanobacterial toxins in freshwater, adverse health effects may range from a mild skin rash to serious illness or in rare circumstances, death.

**What are the symptoms of cyanobacteria exposure?** People can have direct skin contact with water contaminated with cyanobacteria or their toxins during activities like swimming or boating. Their eyes may be exposed from contact with contaminated water or aerosols. Contact with dermal toxins can cause: Allergic dermatitis, including rash, itching, or blisters.

**What are the symptoms of exposure to microcystin?** Gastrointestinal symptoms such as stomach pain, nausea, vomiting, diarrhea, severe headaches, and fever. Runny eyes and nose, cough, and sore throat, pleuritic pain, asthma-like symptoms, or allergic reactions. Exposure to large amount of microcystin can cause liver damage (elevated gamma glutamyl transpeptidase).

**What does cyanobacteria do to the human body?** Not all blooms are harmful, but some cyanobacteria can produce cyanotoxins that can cause serious illness or death in pets, livestock and wildlife. These toxins can also make people sick, and in sensitive individuals also cause a red, raised rash or skin, ear and eye irritation.

**What are the symptoms of algae sickness?** Exposure to high levels of blue-green algae and their toxins can cause diarrhea, nausea or vomiting; skin, eye or throat irritation; and allergic reactions or breathing difficulties. Pet and livestock illness/deaths can happen if animals consume large amounts of water containing blooms, scums or benthic mats.

**How long does it take for cyanobacteria to make you sick?** Symptoms of acute cyanobacterial poisoning may develop within minutes, hours, or days, but most commonly manifest within 24 hours of exposure. Skin rashes may take up to two

days to appear.

**What diseases are caused by algae?** Marine algal bloom can cause many diseases. Eating sea fish and shellfish contaminated with the harmful algal toxin can cause disease in humans as well. Neurotoxic shellfish poisoning, paralytic shellfish poisoning, and Ciguatera fish poisoning are the most common.

**Does boiling water remove algae?** Drinking water Note: Boiling the water will not destroy toxins. Boiling will kill algae but in doing so will release toxins into the water. In fact some toxins become more dangerous as a result of boiling the water.

**Is it safe to walk in water with cyanobacteria?** Swimming, wading, or playing near contaminated water can cause illness. The signs and symptoms of illness can differ based on how someone was exposed, and include skin, nose, or throat irritation; vomiting; stomach pain; and dizziness.

**What kills algae immediately?** Chlorine kills algae by breaking down its cell walls. pH Level: The ideal pH level for a pool is between 7.2 and 7.8. A high pH level can render chlorine ineffective against algae. Total Alkalinity: This parameter affects the stability of your pool's pH level.

**How do humans cause algal blooms?** There are many examples of human activities that contribute to HABs: runoff from agriculture, dissolved chemicals introduced into water supplies via rainfall or irrigation, and effluent from sewage treatment plants all contribute to excess amounts of nutrients in our waterways. These nutrients are food for algae.

**What eats algae blooms?** Some of the known types of fish to eat algae are blennies and tangs, but along with fish there are snails, crabs, and sea urchins who also eat algae. These species are known to eat red slime algae, green film algae, hair algae, diatoms, cyanobacteria, brown film algae, detritus, and microalgae.

**Can cyanobacteria be filtered out of water?** Conventional water treatment (consisting of coagulation, sedimentation, filtration, and chlorination) can generally remove intact cyanobacterial cells and low levels of cyanotoxins from source waters.

**What removes cyanobacteria?** Fortunately, cyanobacteria can be effectively treated with the antibiotic erythromycin. This treatment is safe for fish, plants, and

invertebrates and does not harm the beneficial bacteria in your freshwater tank.

**What chemical kills cyanobacteria?** Algaecides are chemical compounds applied to a waterbody to kill cyanobacteria and destroy the bloom. Several examples are: Copper-based algaecides (copper sulphate, copper II alkanolamine, copper citrate, etc.) Potassium permanganate.

**Does boiling water remove cyanotoxins?** No! Boiling water will not remove cyanotoxins and may increase toxin levels. IF A DRINKING WATER ADVISORY IS ISSUED, IS THE TAP WATER SAFE FOR OTHER USES OTHER THAN DRINKING?

**What are the symptoms of cyanobacteria exposure?** Exposure to high levels of blue-green algae and their toxins can cause diarrhea, nausea or vomiting; skin, eye or throat irritation; and allergic reactions or breathing difficulties. Pet and livestock illness/deaths can happen if animals consume large amounts of water containing blooms, scums or benthic mats.

**How long does it take for blue-green algae to make you sick?** Blue-green algae can produce toxins that affect the nervous system (neurotoxins), liver (hepatotoxins), or skin (dermatotoxins). Neurotoxins have an onset within 60 minutes of exposure.

**Can you walk in water with cyanobacteria?** There is no way to tell if a blue-green algal bloom is toxic just by looking at it. Adults, children, and animals should avoid contact with water with blue-green algae. Toxins can persist in the water after a bloom; watch for signs of recent blooms, such as green scum on the shoreline.

**What eats cyanobacteria?** Amphipods thrive on cyanobacteria But the blooms are spreading northwards with climate change. New research shows that the *Monoporeia affinis* in the northern Bothnian Sea also eat and grow well on cyanobacteria, even the toxic species.

**Can hydrogen peroxide treat cyanobacteria?** ? H<sub>2</sub>O<sub>2</sub> can be used as an effective algicide to reduce cyanobacteria in waste water. ? H<sub>2</sub>O<sub>2</sub> increases the fraction of non-toxic phytoplankton for up to 3 weeks.

dermatotoxins and irritant toxins (Wiegand & Pflugmacher, 2005).

**How do you treat cyanobacteria in humans?** There are no specific antidotes for cyanotoxins or specific treatments for illnesses caused by cyanobacteria and their toxins in humans. For ingestion of contaminated water or food: Stop the exposure by avoiding contaminated food or water. If needed, replenish fluids and electrolytes.

**How toxic is cyanobacteria?** Not all blooms are harmful, but some cyanobacteria can produce cyanotoxins that can cause serious illness or death in pets, livestock and wildlife. These toxins can also make people sick, and in sensitive individuals also cause a red, raised rash or skin, ear and eye irritation.

**What did cyanobacteria lead to?** Cyanobacteria played an important role in the evolution of Early Earth and the biosphere. They are responsible for the oxygenation of the atmosphere and oceans since the Great Oxidation Event around 2.4 Ga, debatably earlier.

**What diseases are caused by cyanobacteria?** The epidemiological studies of human health impacts of chronic cyanobacterial toxins exposure are nascent. They have been associated with neurodegenerative diseases (ND), including Alzheimer's disease (AD), Parkinson's disease (PD), and amyotrophic lateral sclerosis (ALS) [93,94,95,96,97].

**How to test for cyanobacteria in humans?** There is no test available to confirm cyanotoxin poisoning; diagnosis is based on clinical symptoms and signs in association with a history of exposure (e.g. swimming or boating on a river or lake with a current toxic cyanobacterial bloom) and exclusion of other causes.

**What are the effects of cyanotoxins on humans?** Adverse health effects of cyanotoxins include allergic-like reactions (e.g., rhinitis, asthma, eczema, and conjunctivitis), flu-like symptoms, gastroenteritis, respiratory irritation, skin rashes, and eye irritation. More serious adverse health effects may include liver toxicity and neurological effects.
