What is a mixture that results when substances dissolve to form a homogeneous mixture? A solution is a homogeneous mixture consisting of a solute dissolved into a solvent. The solute is the substance that is being dissolved, while the solvent is the dissolving medium. Solutions can be formed with many different types and forms of solutes and solvents.

Which of these is a chemical property of a substance? Examples of chemical properties include flammability, toxicity, acidity, reactivity (many types), and heat of combustion.

Are properties that can be observed directly? A physical property is a characteristic of a substance that can be observed or measured without changing the identity of the substance. Physical properties include color, density, hardness, and melting and boiling points.

What is a change in size, shape, or state of matter? Physical changes are those in which the shape, size, or state of the matter changes, but the substance is still essentially the same. For example, chopping up a carrot or ice melting into water are both physical changes.

What are the 10 examples of a homogeneous mixture?

What is a mixture that forms when substances dissolve and form a homogeneous mixture? A solution is a homogeneous mixture of one or more solutes dissolved in a solvent. Note that the solvent is the substance that is present in the greatest amount.

What are the chemical properties of matter? Chemical Properties of Matter The tendency of matter to react chemically with other substances is known as reactivity. Flammability, toxicity, acidity, the reactivity of various types, and heat of combustion are examples of chemical properties.

What are the different physical and chemical properties of minerals? Minerals can be identified using a number of properties. These include physical and chemical properties such as hardness, density, cleavage and colour, crystallography, electrical conductivity, magnetism, radioactivity and fluorescence.

Is solubility a chemical property? Solubility is a physical property. It refers to the ability of a solute (usually a solid) to dissolve in a solvent (usually a liquid). It's physical because it doesn't change the chemical identity of the substances involved.

What happens when a substance undergoes physical change? In a physical change the appearance or form of the matter changes but the kind of matter in the substance does not. However in a chemical change, the kind of matter changes and at least one new substance with new properties is formed. The distinction between physical and chemical change is not clear cut.

Which type of mixture is characterized by a uniform composition throughout? A homogeneous mixture is a mixture in which the composition is uniform throughout the mixture. The salt water described above is homogeneous because the dissolved salt is evenly distributed throughout the entire salt water sample.

What are the differences between physical and chemical properties in chemistry? physical property: Any characteristic that can be determined without changing the substance's chemical identity. chemical property: Any characteristic that can be determined only by changing a substance's molecular structure.

What is the result a homogeneous mixture? Answer: A homogeneous mixture is uniform at the molecular or atomic level, meaning the components are evenly distributed throughout the mixture, resulting in a single-phase substance.

What is a homogeneous mixture with dissolved particles? A solution is a homogeneous mixture of two or more substances in which the dissolved particles are too small to be seen or to settle out of the mixture. In a solution, the substance CHAPTER 2 PROPERTIES MATTER WORDWISE ANSWERS MTPKITORE

that dissolves is the solute, and the substance that dissolves the solute is the solvent.

What is a homogeneous mixture of substances called? Therefore, a homogeneous mixture of two or more substances is called solution.

What is a homogeneous mixture formed by mixing? By combining two or more substances, a mixture is produced. A homogeneous solution tends to be identical, no matter how you sample it. Homogeneous mixtures are sources of water, saline solution, some alloys, and bitumen. Sand, oil and water, and chicken noodle soup are examples of heterogeneous mixtures.
