ZIMSEC Computer Studies Notes: Frequently Asked Questions and Answers

1. What is the input/output cycle?

The input/output cycle is a sequence of operations that occur when data is transferred between a computer and an external device. It involves the following steps:

- **Input:** The computer receives data from an input device, such as a keyboard or mouse.

- **Processing:** The computer processes the data according to the instructions in its software.

- **Output:** The processed data is sent to an output device, such as a printer or monitor.

2. Explain the difference between primary and secondary storage.

- **Primary storage:** Holds data that is currently being processed by the computer. It is fast but volatile (lost when power supply is cut off).
- **Secondary storage:** Stores data that is not currently being used by the computer. It is slower but non-volatile (data is not lost when power supply is cut off).

3. What are the two main types of software?

- **System Software:** Controls the operation of the computer hardware and provides a platform for application software.
- **Application Software:** Performs specific tasks for users, such as word processing, spreadsheet creation, and database management.

4. Describe the role of a compiler in the software development process.

A compiler is a program that translates high-level source code into low-level machine code. It converts the programmer's instructions into a form that the computer can execute directly.

5. What is a computer network?

A computer network is a collection of computers connected together to share resources and data. Computers on a network can communicate with each other and access shared resources like printers, files, and applications.
