What are gates in math? In essence, a logic gate takes input and produces a single output by performing operations on the input. In this way, logic gates are analogous to functions in mathematics. The input and output for a logic gate is in the form of bits (binary digits) which are either 1s or 0s.

What are gates in deep learning? Abstract. Rectified linear unit (ReLU) activations can also be thought of as gates, which, either pass or stop their pre-activation input when they are on (when the pre- activation input is positive) or off (when the pre-activation input is negative) respectively.

Question 1:

Find the solution to the recurrence relation $f(n) = f(n-1) + f(n-2)$ with initial conditions $f(0) = 1$ and $f(1) = 1$.

Answer:

Using the given initial conditions, we have the following:

- $f(0) = 1$
- $f(1) = 1$
- $f(2) = f(1) + f(0) = 1 + 1 = 2$
- $f(3) = f(2) + f(1) = 2 + 1 = 3$
- $f(4) = f(3) + f(2) = 3 + 2 = 5$
- ... The solution to the recurrence relation is the Fibonacci sequence:
- $f(n) = F(n) = (1 + ?5)^n - (1 - ?5)^n / 2^n?5$

Question 2:

Prove that the set of all polynomials with real coefficients is an infinite set.

Answer:

Let P be the set of all polynomials with real coefficients. Assume for the sake of contradiction that P is finite. Then there exists a polynomial $p(x)$ of degree n that is the highest degree polynomial in P.

Consider the polynomial $q(x) = p(x) + x^{(n+1)}$. Since $q(x)$ is not divisible by $x^{(n+1)}$, it cannot be in P. However, $q(x)$ is a polynomial with real coefficients, so it must be in P. This contradicts our assumption, so P must be an infinite set.

Question 3:

Find the number of ways to select 3 objects from a set of 5 objects.

Answer:

Using the formula for combinations, we have:

- nCr = n! / (r!(n-r)!)

- 5C3 = 5! / (3!(5-3)!) = 5! / (3!2!) = 10

Therefore, there are 10 ways to select 3 objects from a set of 5 objects.

Question 4:

Prove that the sum of the squares of two odd integers is an even integer.

Answer:

Let x and y be two odd integers. Then x can be expressed as x = 2k + 1 and y can be expressed as y = 2l + 1, where k and l are integers.

The sum of the squares of x and y is:

- x^2 + y^2 = (2k + 1)^2 + (2l + 1)^2

- x^2 + y^2 = 4k^2 + 4k + 1 + 4l^2 + 4l + 1

- x^2 + y^2 = 4(k^2 + k + l^2 + l) + 2

Since the term 4(k^2 + k + l^2 + l) is divisible by 4, the entire sum is divisible by 4. Therefore, the sum of the squares of two odd integers is an even integer.

Question 5:

Find the number of edges in a complete graph with 6 vertices.

Answer:

A complete graph with n vertices has (n^2 - n) / 2 edges. Therefore, a complete graph with 6 vertices has (6^2 - 6) / 2 = 15 edges.
