Question 1: Explain the concept of a Von Neumann architecture.

Answer: The Von Neumann architecture is a computer architecture where all instructions and data are stored in the same memory, and where the same hardware is used to fetch both instructions and data. This architecture was developed by John von Neumann in the 1940s, and it has been the basis for most computers since then.

Question 2: Describe the difference between a register and a memory location.

Answer: A register is a small, high-speed memory location that is located on the CPU chip. Registers are used to store frequently used data and instructions, and they can be accessed much faster than memory locations. Memory locations, on the other hand, are located in the computer's main memory, and they are used to store

data that is not currently being used by the CPU.

Question 3: Explain the concept of a bus.

Answer: A bus is a set of wires that connects different components of a computer. The CPU, memory, and input/output devices are all connected to the bus, and they use the bus to communicate with each other. The bus is responsible for transferring data and control signals between the different components of the computer.

Question 4: Describe the different types of memory.

Answer: There are two main types of memory: volatile memory and non-volatile memory. Volatile memory loses its contents when the power is turned off, while non-volatile memory retains its contents even when the power is turned off. RAM (random access memory) is a type of volatile memory that is used to store data and instructions that are currently being used by the CPU. ROM (read-only memory) is a type of non-volatile memory that is used to store data that is not likely to change, such as the computer's BIOS (basic input/output system).

Question 5: Explain the concept of a cache.

Answer: A cache is a small, high-speed memory that is used to store frequently used data and instructions. The cache is located between the CPU and the main memory, and it is used to reduce the amount of time that the CPU has to wait for data from the main memory. When the CPU needs to access data, it first checks the cache to see if the data is already there. If the data is in the cache, the CPU can access it much faster than it could if it had to retrieve it from the main memory.

Which three tasks can be performed by the node manager? A Node Manager process can automatically monitor, shutdown, and restart only those Managed

Servers that it started.

What is the overview of NNMi? Overview. OpenText™ Network Node Manager i (NNMi) delivers powerful capabilities enabling NOCs to manage modern networks. NNMi Smart Plug-ins expand NNMi into specialized environments, helping your team reduce time to resolve issues. NNMi is a core component of Network Operations Management.

What is the purpose of node manager? Node Manager is a WebLogic Server utility that enables you to start, shut down, and restart Administration Server and Managed Server instances from a remote location. Although Node Manager is optional, it is recommended if your WebLogic Server environment hosts applications with high availability requirements.

What is the difference between admin server and node manager? The Admin Node Manager (ANM) is the central administration server for an API Gateway domain, and is responsible for performing management operations across the domain. The Node Manager (NM) on each machine manages all the local gateways on that machine, regardless of the group they are in.

How does NNMi work? EMI, which stands for Equated Monthly Instalment, refers to a predetermined fixed payment that borrowers make to lenders on a specific date each month. This regular instalment includes both the principal amount and the interest, allowing borrowers to gradually repay their loans over a set period.

How to add node in NNMi? You can easily add one or more Nodes to a Node Group from any Nodes or map view using the Actions menu. NNMi adds the selected nodes to the Node Group specified. When adding Nodes to an existing Node Groups using the Actions menu, note the following: Multiple nodes can be associated with one Node Group.

What is NNM in networking? A network node manager can automatically discover devices in the network, create a network topology map, and provide a visual representation of the network's structure. These network topology maps enable the manager to quickly develop and monitor the device inventory connectivity. Detecting and troubleshooting issues.

What happens if node manager goes down? Killing nodemanager will only affect the containers of this particular node. All the running containers will get lost on restart/kill. They will get relaunched once the node comes up or the nodemanager process get start(if application/job still running).

What is a manager node? This node is responsible for providing certain tasks, such as file system configuration changes, quota management, and free space management. In addition, manager nodes are responsible for token management throughout the cluster.

What is the purpose of a node in a network? Each network node acts as a connection point for data transmission, process recognition, packet switching, and network distribution. Generally, nodes are programmed to identify, process, and transmit data from one node to another. They can perform several functions based on the application and network.

Can we start managed server without node manager? You can't start or stop a Managed Server with WLST without first connecting to the Node Manager. However, you can use WLST commands to start the Admin Server without the Node Manager running. The following example shows how to start the Admin Server for the medrec domain after invoking WLST with the java weblogic.

How do I start an admin server with node manager?

What is node management? Node Management provides multiple capabilities for managing EC2 instances, on-premises servers or virtual machines (VMs) in a hybrid environment, as well as other types of AWS resources.

What is NNMi used for? NNMi helps you monitor health and availability of physical and virtual devices and detect faults on your network.

How can I check my NNMi status? From the NNMi console, select Tools ? NNMi Status. NNMi displays a list showing the status of each process and service. Each process and service should be running. If one is not, contact your NNMi administrator.

How to install NNMi?

How do I connect to node?

How to setup a node?

How do I add a user to my NNMi account?

What is the NNM? In order to address malnutrition in India, Govt. of India has approved setting-up of National Nutrition Mission (NNM) and to roll it out in a phased manner with an aim to achieve improvement in nutritional status of children in the age group of 0-6 years, pregnant women and lactating mothers.

Intel Intelligent Power Node Manager and Intel® Data Center Manager (Intel® DCM) are platform-software-based features that reside on the Intel® Xeon® processor 5500 series, providing power, thermal monitoring, and policy-based power management for individual servers, racks of servers, and/or data centers.

What is node management? Node Management provides multiple capabilities for managing EC2 instances, on-premises servers or virtual machines (VMs) in a hybrid environment, as well as other types of AWS resources.

What are the 4 types of data management?

What is the role of a data manager? A Data Manager is a professional who oversees the development and use of data systems, ensuring effective data management, secure procedures, and data analysis.

Which tool is used for data management? Data integration tools are software applications that allow users to combine and manage data from different sources. Popular tools include Informatica, Talend, IBM InfoSphere, Microsoft SQL Server Integration Services (SSIS), and Oracle Data Integrator.

What happens if node manager goes down? Killing nodemanager will only affect the containers of this particular node. All the running containers will get lost on restart/kill. They will get relaunched once the node comes up or the nodemanager process get start(if application/job still running).

What is the difference between resource manager and node manager? The Resource Manager also monitors applications and provides other services. It generally runs on the head node of the Hadoop cluster. Node managers are responsible for launching and monitoring containers that are launched on worker nodes of the cluster. A node manager runs on every worker node in the cluster.

What is container in node manager? In simple terms, Container is a place where a YARN application is run. It is available in each node. Application Master negotiates container with the scheduler(one of the component of Resource Manager). Containers are launched by Node Manager.

What is node process manager? Node. js process manager is a tool, which provides an ability to control application lifecycle, monitor the running services and facilitate common system admin tasks to maintain your project operability.

What is a node vs CPU? 1.1 What is a node? A node is the name usually used for one unit (usually one computer) in a computer cluster. Generally, this computer will

have one or two CPUs, each normally with more than one core. The memory is always shared between cores on the same CPU, but generally not between the CPUs.

What are processor nodes? A processing node is the host of processing elements (PEs) which perform data processing tasks on events.

What is a network node used for? A network node is a connection point in a communications network. Each node is an endpoint for data transmissions or redistribution. Nodes have either a programmed or engineered capability to recognize, process and forward transmissions to other network nodes.

What is a manager node? This node is responsible for providing certain tasks, such as file system configuration changes, quota management, and free space management. In addition, manager nodes are responsible for token management throughout the cluster.

Why is node used? Node JS is a server-side platform that allows developers to build high-performance apps using JavaScript. Node JS uses an event-driven, non-blocking I/O model, making it ideal for building fast and scalable apps.
