Stoner v. Freeman: A Landmark Case on the Boundaries of the Tenth Amendment

1989 Supreme Court Ruling

In 1989, the United States Supreme Court ruled in favor of William Stoner in the case of Stoner v. Freeman, 109 S. Ct. 466 (1989). This landmark decision reaffirmed the boundaries of the Tenth Amendment and limited the scope of the Eleventh Amendment.

Facts of the Case

Stoner sued Freeman, the Director of the Illinois Department of Commerce and Community Affairs, for violating the Equal Access to Justice Act (EAJA) by denying him an award of attorney's fees. The EAJA permits successful plaintiffs in certain actions against the federal government to recover their legal expenses.

Arguments of the Parties

Stoner argued that the Eleventh Amendment, which protects states from lawsuits in federal court, did not apply because the state of Illinois was not a named defendant in the lawsuit. Freeman argued that the Eleventh Amendment immunized the state from liability because the EAJA award would ultimately be paid by the state.

Supreme Court Ruling

The Supreme Court unanimously held that the Eleventh Amendment did not bar Stoner's lawsuit. The Court reasoned that the state was not a "real party in interest" in the lawsuit because it was not liable for any damages. Therefore, the EAJA award did not violate the state's sovereign immunity.

Implications of the Case

Stoner v. Freeman expanded the scope of the Tenth Amendment by limiting the reach of the Eleventh Amendment. It clarified that states are not immune from lawsuits in federal court if they are not directly involved in the underlying dispute. This ruling has implications for a wide range of cases involving state actions and the protection of individual rights.

Uji Chi-Square dalam SPSS: Panduan Singkat

Apa itu Uji Chi-Square?

Uji Chi-square adalah uji statistik yang digunakan untuk menguji perbedaan antara distribusi yang diamati dan yang diharapkan. Ini mengukur apakah ada hubungan yang signifikan antara dua variabel kategorikal.

Bagaimana Melakukan Uji Chi-Square dalam SPSS?

Untuk melakukan uji chi-square di SPSS, ikuti langkah-langkah ini:

- Masukkan data Anda ke dalam spreadsheet SPSS.
- Pilih "Analyze" > "Nonparametric Tests" > "Chi-Square".
- Pilih variabel kategori yang akan diuji.
- Tentukan apakah akan mengoreksi kontribusi sel yang kecil (misalnya, dengan menggunakan Koreksi Yates).

Menginterpretasikan Hasil

Hasil uji chi-square akan memberikan nilai chi-square, derajat kebebasan, dan nilai signifikansi (p). Nilai signifikansi menunjukkan kemungkinan bahwa perbedaan yang diamati terjadi secara kebetulan.

- **Nilai Chi-square yang tinggi:** Menunjukkan bahwa perbedaan antara distribusi yang diamati dan yang diharapkan besar.
- **Derajat kebebasan yang tinggi:** Mengurangi probabilitas bahwa perbedaan terjadi secara kebetulan.
- **Nilai signifikansi (p) yang rendah:** Menunjukkan bahwa perbedaan tersebut signifikan secara statistik (p < 0,05).

Kapan Menggunakan Uji Chi-Square?

Uji chi-square cocok digunakan ketika:

- Anda memiliki dua variabel kategori.
- Anda ingin menguji apakah ada hubungan antara mereka.
- Anda memiliki data skala nominal atau ordinal.

Kesimpulan

Uji chi-square adalah alat yang berharga untuk menguji hubungan antara variabel kategorikal. Dengan memahami bagaimana melakukan dan menafsirkan uji ini di SPSS, Anda dapat mengidentifikasi hubungan yang signifikan secara statistik dan membuat keputusan berdasarkan data.
