Which activation function is best in neural network? The ReLU is the most used activation function in the world right now. Since, it is used in almost all the convolutional neural networks or deep learning. As you can see, the ReLU is half rectified (from bottom). f(z) is zero when z is less than zero and f(z) is equal to z when z is above or equal to zero.

Do neural networks need activation function? Most real-world data is non-linear. For example, relationships between house prices and size, income, and purchases, etc., are non-linear. If neural networks had no activation functions, they would fail to learn the complex non-linear patterns that exist in real-world data.

Why is ReLU better than Sigmoid? ReLU activation offers faster convergence compared to Sigmoid activation due to its characteristics. Sigmoid activation typically yields gradients between 0 and 1, which can multiply and result in exponentially small overall gradients in deep networks.
