When we think about a large-scale move of a large group of people within the U.S., we can think about African or black Americans who in-migrated from the south to the north after the Civil War. After the Civil War, there were more opportunities and the north was more inclusive of African or black Americans.

What are the 5 stages of a cell? Mitosis is conventionally divided into 5 phases: prophase, metaphase, anaphase and telophase, and cytokinesis. In interphase, a nuclear envelope surrounds the nucleus, the DNA is replicated in the S phase, and the sister chromatids join together at the central portion of the chromosome - the centromere.

What controls cell migration? Three important factors regulate 3D cell migration: cell-matrix adhesions, the Rho family of small GTPases, and proteases. In 2D culture, integrins are primarily responsible for cell adhesions to ECM in the form of focal adhesions (FAs), focal contacts, podosomes, etc.
