**Solubility Lines for Aqueous Solutions**

**Question 1:** What is a solubility line?

**Answer:** A solubility line is a graphical representation of the relationship between the temperature of a solvent and the amount of solute that can be dissolved in it. It shows the maximum amount of solute that can be dissolved at a given temperature.

**Question 2:** How can solubility lines be used to predict the solubility of a solute?

**Answer:** By finding the intersection of a vertical line representing the desired temperature with the solubility line for the specific solute, one can determine the maximum amount of solute that can be dissolved in the solvent at that temperature.

**Question 3:** What is a saturated solution?

**Answer:** A saturated solution is a solution that contains the maximum amount of solute that can be dissolved in the solvent at a given temperature. It is represented by a point on the solubility line.

**Question 4:** What happens when a solution contains more solute than it can hold?

**Answer:** If a solution contains more solute than it can hold, the excess solute will precipitate out of solution as a solid. This is known as supersaturation.

**Question 5:** How can solubility lines be used to compare the solubilities of different solutes?

**Answer:** By comparing the slopes of the solubility lines for different solutes, one can determine which solute is more soluble in a given solvent. The steeper the slope, the greater the solubility.
