1. What is the purpose of the OPTIMIZER_MODE parameter?

The OPTIMIZER_MODE parameter specifies the optimization mode used by the Oracle optimizer. The default value is "ALL_ROWS", which considers all rows in the table when optimizing a query. Other options include "FIRST_ROWS", which considers only the first N rows, and "RULE", which uses rule-based optimization.

2. How can you identify slow SQL statements?

Slow SQL statements can be identified using the Oracle Enterprise Manager (OEM) or by running the EXPLAIN PLAN statement. The EXPLAIN PLAN statement provides detailed information about the execution plan of a query, including the operations performed, the number of rows processed, and the estimated execution time.

3. What are the different types of indexes in Oracle?

Oracle supports several types of indexes, including:

- B-tree indexes: The most common type of index, used for quick lookups on a single column.
- Hash indexes: Used for faster lookups than B-tree indexes, but only on equality comparisons.
- Bitmap indexes: Used for faster lookups on columns with low cardinality.
- Function-based indexes: Used to index the results of a function or expression.

4. How can you optimize queries for performance?

Queries can be optimized for performance by using appropriate indexes, optimizing the execution plan, and eliminating unnecessary operations. The Oracle optimizer can also be tuned using parameters such as OPTIMIZER_MODE and STATISTICS_LEVEL.

5. What are the benefits of using Oracle SQL Tuning Advisor?

Oracle SQL Tuning Advisor is a tool that can help identify and fix performance problems in SQL statements. It analyzes SQL statements, provides recommendations for improving performance, and generates optimized execution plans. Using SQL Tuning Advisor can save time and effort in optimizing queries.
