Some do it approaching 4 miles, many do it at 5 miles, some at 6 miles. Depending on the specific aircraft's procedures, we'll announce 'Gear Down, 3 Green' as we prepare to extend the landing gear.

Why does no one want an A380? With the aircraft's high operating costs, not to mention the roughly ??$446 million price tag of the A380, airlines need those seats filled in order for the A380 to be profitable. altitude. Crew Considerations. Extended flight with the gear locked down is very noisy, impacting on both the environment within the cabin and on pilot fatigue levels.

Why is 737 landing gear so low? Since the plane was deliberately designed to be below, there wasn't enough space under the aircraft to accommodate wheel well doors for the main landing gear. If implemented, the doors will likely come in contact with the runway, taxiway, or apron surface should they be deployed on the ground.

Why don't airplane wheels spin before landing? No they don't spin prior to touch-down. Aside from the cost & weight of the wheel-spinning gubbery, pre-spinning would lengthen landing roll, requiring more braking force & wear & tear.

Sero Prevalence of Newcastle Disease in Humans and Frequently Asked Questions

Newcastle disease (ND) is a highly contagious viral disease that primarily affects poultry and can occasionally infect humans. To understand the extent of human exposure to ND, seroepidemiological studies assess the prevalence of antibodies against the virus in the population.

Q: What is sero prevalence?

A: Sero prevalence refers to the percentage of individuals in a population who have antibodies against a specific pathogen, indicating previous exposure or vaccination.

Q: How is ND diagnosed in humans?

A: Human ND infections are typically mild and self-limiting, resembling influenza-like symptoms. Diagnosis involves laboratory tests to detect the virus or antibodies in blood samples.

Q: What is the global sero prevalence of ND in humans?

A: Sero prevalence studies have shown wide variations in different populations. In regions where ND is endemic in poultry, human sero prevalence can range from 10% to 50%. In areas with no poultry outbreaks, sero prevalence is typically below 5%.

Q: What factors influence ND sero prevalence in humans?

A: Several factors contribute to ND sero prevalence, including exposure to infected poultry, occupation, age, and vaccination status. Individuals who work with poultry or live in areas with high poultry density are at higher risk of exposure. Children are more likely to have antibodies due to natural infections. Vaccination can also increase sero prevalence.

Conclusion:

Sero prevalence studies provide valuable insights into the extent of human exposure to Newcastle disease virus. The prevalence of ND antibodies in a population can inform public health policies and vaccination strategies. While human ND infections are generally mild, ongoing surveillance and research are essential to monitor the virus and prevent potential outbreaks.
