What is the grade of Iicl container? IICL containers are the highest criteria in the industry for used shipping containers. IICL containers have been used to move goods and are in good physical and cosmetic condition. An IICL rating ensures that they can withstand the demands of overseas shipping or any domestic storage use.

What does IICL mean on shipping containers? IICL stands for "International Institute of Container Lessors". Essentially, the IICL has created a standard of inspection for industries the utilize containers for shipping. It ensures that an ISO Storage Container meets the requirements to be utilized in shipping service (by leasing companies) to transport cargo.

Solution Manual for Applied Econometric Time Series by Enders

Question 1: Consider a time series model with the following equation:

```
Y_t = 0.5Y_{t-1} + \epsilon_t
```

where (\epsilon_t) is a white noise error term. Find the autocovariance function of this process.

Answer: The autocovariance function is given by:

```
?(h) = Cov(Y_t, Y_{t+h}) = 0.5^{|h|} ?^2
```

where (\sigma^2) is the variance of (\epsilon_t).

Question 2: Suppose we have a time series of quarterly GDP data that exhibits a seasonal pattern. How can we remove the seasonal component from the data?

Answer: One common approach to remove seasonality from data is to use seasonal differencing. This involves subtracting the value of the time series at the same quarter in the previous year.

Question 3: What is the Box-Jenkins methodology for time series analysis?

Answer: The Box-Jenkins methodology is a step-by-step procedure for identifying, estimating, and forecasting time series models. It consists of four main stages:

1. Identification: Investigating the time series and identifying potential patterns and relationships.
2. Estimation: Using statistical techniques to estimate the parameters of the chosen model.
3. Diagnostic checking: Evaluating the model and checking for any deviations from the assumptions.

4. Forecasting: Using the fitted model to predict future values of the time series.

Question 4: Suppose we have a time series model with a unit root. What does this imply about the stationarity of the process?

Answer: A unit root in a time series model implies that the process is non-stationary. This means that the mean and variance of the process are not constant over time, making it difficult to forecast.

Question 5: How can we use the concept of autoregression to predict future values of a time series?

Answer: Autoregression involves using past values of the time series to predict future values. This is achieved by estimating an autoregressive model of the form:

`Y_t = ?_1Y_{t-1} + ?_2Y_{t-2} + ... + \epsilon_t`

where ($\phi_1, \phi_2, ...$) are the autoregressive coefficients and (ϵ_t) is the error term.
