Solutions of P.S. Gill Engineering Drawing: Questions and Answers Breathing Space

1. What is the concept of orthographic projection?

Orthographic projection is a two-dimensional representation of a three-dimensional object, where the object is viewed from multiple angles. The resulting projections are perpendicular to each other, creating a clear understanding of the object's shape and dimensions.

2. Explain the difference between first angle and third angle projection.

In first angle projection, the object is placed between the observer and the projection plane. In third angle projection, the object is placed behind the projection plane. The difference lies in the way the views are arranged: in first angle projection, the front view is placed on the left, while in third angle projection, it is placed on the right.

3. What are the steps involved in creating an orthographic drawing?

- Identify the principal views of the object.
- Draw the front view.
- Draw the other views perpendicular to the front view.
- Project elements from the front view to the other views.

- Dimension and annotate the drawing.

4. Describe the different types of lines used in engineering drawings.

Engineering drawings use various types of lines to convey different information:

- **Visible lines:** Solid lines that indicate the visible edges of an object.
- **Hidden lines:** Dashed lines that indicate the hidden edges of an object.
- **Center lines:** Long dashed lines that indicate the center of an object.
- **Dimension lines:** Thick lines with arrowheads that indicate the dimensions of an object.

5. What are the common mistakes to avoid in engineering drawings?

- Omitting hidden lines
- Incorrect dimensions
- Incomplete annotation
- Ambiguous or cluttered drawings
- Poorly organized views
