How to prepare JavaScript for an interview?

How to test JavaScript skills?

What is the difference between == and === in JavaScript interview questions? The main difference between the two operators is how they compare values. The == operator compares the values of two variables after performing type conversion if necessary. On the other hand, the === operator compares the values of two variables without performing type conversion.

Is JavaScript front-end or backend? Front-end devs use front-end programming languages like HTML, CSS, and JavaScript.

What is JavaScript in one word? JavaScript is a lightweight interpreted programming language. The web browser receives the JavaScript code in its original text form and runs the script from that.

How many data types are in JavaScript? JavaScript data types are broadly categorized into primitive and non-primitive types. The primitive data types include Number, String, Boolean, Null, Undefined, and Symbol. Non-primitive types include Object, Array, and Function.

What basic knowledge is required for JavaScript? Before learning JavaScript, you must know how to code with Hypertext Markup Language (HTML) and Cascading Style Sheets (CSS). That's because these two tools are fundamental to web development. HTML provides the basic framework for websites, and CSS adds styling elements, like font color, size, and layout.

How do you memorize a script for an interview?

What tool to test JavaScript? Jest is a JavaScript testing framework designed to ensure correctness of any JavaScript codebase. It allows you to write tests with an approachable, familiar and feature-rich API that gives you results quickly.

How can I practice my JavaScript?

How to check keys in JavaScript? To properly check if a key exists in JavaScript, we suggest using the in operator or hasOwnProperty() . These ways are more reliable for checking keys. "The best way to check the presence of a key in an object is by using the in operator or the hasOwnProperty() method."

How to crack a JavaScript interview?

What is a JavaScript short answer? JavaScript is an open-source programming language. It is designed for creating web-centric applications. It is lightweight and interpreted, which makes it much faster than other languages. JavaScript is integrated with HTML, which makes it easier to implement JavaScript in web applications.

What does !== mean in JavaScript? !== means "not equal value or not equal type". It is a comparison operator in JavaScript that checks if the two values being compared are not equal in either value or data type. For example, 5 !== "5" would return true because although the values are the same, the data types are not.

Is CSS backend or frontend? The frontend uses HTML, CSS, JavaScript, and frontend frameworks. The backend uses programming languages like Java, Python, Ruby, APIs, and database management systems.

Is SQL backend or frontend? SQL is the most common backend language. It is used to interact with databases and to create and maintain relational databases.

Which is harder, frontend or backend? Backend development can be more challenging to start, but once you understand the languages and processes involved, it can be easier to proceed because there are fewer technologies to learn. On the whole, however, frontend development is typically the easier subject to learn.

How to say hello word in JavaScript? console. log('Hello, World! '); prints the 'Hello, World!'

Is JavaScript synchronous or asynchronous? JavaScript is synchronous by default: every line of code is executed one after the other, and each task must wait for the previous one to be completed before moving to the next. In the above example, the first line of code, One , will be logged first, followed by the second line, Two , and the third line, Three .

Why is JavaScript called script? JavaScript is a scripting language that can control or change web pages and web servers. It is interpreted, which means it can run as it is, without any extra steps. It can also use dynamic execution, which means it can run some instructions in a different or better way than they are written.

What are the 7 data types in JavaScript?

What is the difference between == and === in JS? Basically, the only real difference is that === includes the type in the comparison; whereas == is just the value.

What are the six types of values in JavaScript? Numbers represent numeric values, strings represent text, booleans represent true or false values, arrays store multiple values in an ordered list, objects store key-value pairs, null represents the intentional absence of any object value, and undefined represents the absence of a defined value.

What is JavaScript in simple terms? JavaScript is a scripting language for creating dynamic web page content. It creates elements for improving site visitors' interaction with web pages, such as dropdown menus, animated graphics, and dynamic background colors.

What is JavaScript simple description? JavaScript is a programming language that adds interactivity to your website. This happens in games, in the behavior of responses when buttons are pressed or with data entry on forms; with dynamic styling; with animation, etc.

How do you explain JavaScript to a child? JavaScript is known as the 'programming language of the web'. It is used by front-end developers in combination with HTML and CSS to make up the core components of web technology; JavaScript programs the interactivity of a website, HTML the structure, and CSS the style.

What is JavaScript for beginners? JavaScript is a lightweight programming language commonly used by web developers to add dynamic interactions to web pages, applications, servers, and even games. It works seamlessly alongside HTML and CSS, complementing CSS in formatting HTML elements while providing user interaction, a capability that CSS alone lacks.

Why do we use === in JavaScript? The strict equality (===) operator checks whether its two operands are equal, returning a Boolean result. Unlike the equality operator, the strict equality operator always considers operands of different types to be different.

What is the main purpose of JavaScript? JavaScript is a programming language used to create dynamic content for websites. It achieves this by adding new HTML elements while modifying existing ones. Many coders enhance web development skills using JavaScript to create user-friendly and interactive websites.

What is the most common use of JavaScript? JavaScript is commonly used to make web pages dynamic. As a client scripting language, it provides websites with interactivity like prompts and alerts and it can add animations to images and text. BairesDev's development of web apps for MTV provides a good example of

JavaScript being used in web development.

How exactly JavaScript works? JavaScript code is executed by the browser or JavaScript engine rather than being compiled into machine language beforehand. This makes it highly portable across different platforms. Modern engines such as V8 utilize Just-In-Time (JIT) technology to compile code into directly executable machine code.

What is the basic concept of JavaScript?

What is JavaScript example? JavaScript provides users to interact with web pages as per the below examples as per the requirements. Show/hide more data or user information using with the click of a button. Change the color of a button after hovering the mouse hovers over it. Slide by a carousel of images on the home webpage.

How does JavaScript read? The source code is passed through a program called a compiler, which translates it into bytecode that the machine understands and can execute. In contrast, JavaScript has no compilation step. Instead, an interpreter in the browser reads over the JavaScript code, interprets each line, and runs it.

What is function in JavaScript in simple words? A function in JavaScript is similar to a procedure—a set of statements that performs a task or calculates a value, but for a procedure to qualify as a function, it should take some input and return an output where there is some obvious relationship between the input and the output.

What is a monkey code in JavaScript? Monkey patching in JavaScript refers to the practice of modifying or extending the behavior of existing objects or functions at runtime. It involves adding, modifying, or overriding properties and methods of an object without altering its original source code.

What is JavaScript in easy words? JavaScript is a dynamic programming language that's used for web development, in web applications, for game development, and lots more. It allows you to implement dynamic features on web pages that cannot be done with only HTML and CSS.

What is a JavaScript short answer? JavaScript is an open-source programming language. It is designed for creating web-centric applications. It is lightweight and interpreted, which makes it much faster than other languages. JavaScript is integrated with HTML, which makes it easier to implement JavaScript in web applications.

What is the easiest way to learn JavaScript? If you are a beginner, we recommend starting with an online course or video tutorial. There are many great resources available online, and you can learn at your own pace. Once you have a basic understanding of JavaScript, you can start working on personal projects or attending coding bootcamps to further your skills.
