What is the formula for the exponential function? An exponential function is a Mathematical function in the form f (x) = ax, where "x" is a variable and "a" is a constant which is called the base of the function and it should be greater than 0. The most commonly used exponential function base is the transcendental number e,

which is approximately equal to 2.71828.

How to tell if a graph is growth or decay? It's exponential growth when the base of our exponential is bigger than 1, which means those numbers get bigger. It's exponential decay when the base of our exponential is in between 1 and 0 and those numbers get smaller. An asymptote is a value that a function will get infinitely close to, but never quite reach.

What is exponential function examples with answers? Common examples of exponential functions are functions that have a base number greater than one and an exponent that is a variable. One such example is $y=2^x$. Another example is $y=e^x$.
